

FortiAnalyzer 3.0 firmware released

Fortinet announced FortiAnalyzer 3.0, a new firmware release for the product formerly known as FortiLog, whose name change better reflects the product line's significant increase in functionality. Fortinet also announced two new appliances in the FortiAnalyzer family — the 100A and 2000 models — targeted at small/medium business (SMB) and large enterprise deployments, respectively. The FortiAnalyzer 3.0 firmware will run on the new appliance models as well as Fortinet's existing FortiLog-400 and -800 appliances.

The new FortiAnalyzer appliances deliver scalable capacity, performance and enhanced 3.0 firmware features, providing administrators with a single source for gathering, correlating, analyzing and storing event data from dispersed FortiGate security appliances across their network security infrastructure. It provides capacity and performance to meet the varied security analyzing, logging and reporting needs.
