

## **Large network security appliance**

Fortinet has released two high-performance security appliances in its FortiGate system family for large enterprise networks that require comprehensive multi-threat protection and security system reliability features.

It has also announced FortiAccel technology that significantly accelerates small packet firewall performance.

The FortiGate-1000A is an ASIC-accelerated enterprise security appliance that delivers multi-gigabit performance and multi-threat security features. The FortiGate 1000AFA2 appliance includes an additional two FortiAccel small form factor pluggable ports that accelerate small packet performance required for voice, video and other multimedia streaming applications and provides multi-gigabit, wire-speed firewall performance for all-sized packets.

Key features in both enterprise security appliances include: multi-gigabit performance with 10 copper gigabit 10/100/1000Base-T ports and FortiASIC content processor 5 (CP5); clustering, device failure detection and notification and dual hot-swappable power supply and fan features; and integrated multi-threat protection with security functions such as firewall, VPN, antivirus, web filtering, intrusion prevention, anti-spam and traffic shaping.
