

Network security

Fortinet has announced a major firmware upgrade for its family of FortiGate and FortiManager systems that will enhance users' security posture and ease the means by which they deploy and manage network security.

Through an array of updated features, FortiOS 3.0 and FortiManager 3.0 bring new capabilities that enable more granular security for online applications, including complete content protection for instant messaging and enhanced security for peer-to-peer traffic. Additionally, tighter integration between Fortinet's FortiGate, FortiManager and FortiAnalyzer systems enables more robust centralised network security management, reporting and analysis for enterprises and MSSPs.

FortiOS 3.0 firmware delivers an advanced security and management platform through integration with its FortiAnalyzer and FortiManager systems — providing increased network protection with advanced provisioning, reporting, logging, alerts and event correlation for all of Fortinet's security products.
