Fortinet joins Microsoft's VIA

Fortinet, provider of unified threat management (UTM) solutions, announced in Bangalore on Monday that it has joined the Microsoft Virus Information Alliance (VIA), a centralised resource for Internet users seeking information about the latest virus threats affecting Microsoft technology.

The VIA is comprised only of industry leading security vendors upon whom Microsoft relies to provide valuable technical information on newly discovered viruses.

As part of this alliance, the Fortinet Global Security Research Team will work to further empower Microsoft to more quickly address vulnerabilities and communicate solutions to its customers.
