Threat Investigation Made Easy

The FortiGate App for Splunk combines the best security information and event management (SIEM) and threat prevention by aggregating, visualizing and analyzing hundreds of thousands of log events and data from FortiGate physical and virtual firewall appliances. The App dramatically improves the detection, response and recovery from advanced threats by providing broad security intelligence from data that is collected across the cloud.

Fortinet FortiGate App for Splunk

Every business has its specific demand and tolerance in terms of recovery and response time objectives to security events. The Fortinet FortiGate App for Splunk provides the Threat and UTM Dashboard, which offers presets and configuration to identify anomalous behavior.

FortiOS threat intelligence is built in the default App interface to quickly sort and de-duplicate threats. Instantaneous charting and pivoting on data analytics can pinpoint security breaches across multiple domains and geographic areas. Businesses can fulfill the fastest Response and Recovery Time Objectives with real-time information throughout Fortinet firewall infrastructure.

Benefits

- Visualizes logging data efficiently with integrated security analysis
- Makes data aggregation easier by interacting with pre-defined security metrics
- Improves protection from advanced threats with built-in Threat and UTM dashboards
- Extends datacenter security awareness with real-time monitoring and trending
The App can absorb a high volume of elevated logs in real time and provide insights to examine advanced threat intent, widespread backdoor viruses, and unexpected information flows in a single pane of glass, enabling quick visualization of everything that’s happening in your datacenter and cloud.

The Fortinet FortiGate App for Splunk solution delivers advanced security reporting and analysis in the datacenter that benefits operational reporting, as well as providing simplified and configurable dashboard views across Fortinet firewall appliances, physical and virtual. It enables security analysts, administrators, and architects to correlate application and user activities across all network and security infrastructures from a real-time and historical perspective.

**Security & Compliance**

In the wake of high-profile data breaches, governments are looking to expand penalties for companies who are non-compliant, instead of just treating compliance mandates like PCI as a baseline for security. Security analytics are usually conducted manually and it becomes very time-consuming to drill into specific events, making the data mining process easily error-prone. Fortinet FortiGate App for Splunk is an enterprise-ready solution that effectively and efficiently inspects threats through up-leveled visualization. Less data loss means less revenue loss. This allows businesses to focus on critical investigations by responding more quickly to each data breach.
**Seamless Integration with FortiGate Firewalls**

The FortiGate App also verifies current and historical logs and administrative events including firewall, anti-virus, IPS and application control. All features are supported with Fortinet VDOM enabled, in both NAT and Transparent mode. Most common traffic protocols are supported and included over IPv4 such as:

- **TCP**: telnet, http, ftp
- **UDP**: syslog, tftp
- **ICMP**: ping
