

ABBOTSFORD SECURES ITS NETWORK & ENABLES BYOD WITH NETWORK ACCESS CONTROL

INTRODUCTION

The Abbotsford School District in the city of Abbotsford, BC, has about 18,500 students and 2,100 teachers and staff at its 46 schools. Every classroom has wireless devices, including document cameras, projectors, and a laptop/desktop for the teacher. The district also provides tablets, laptops, and lab devices for students—about 10,000 devices in total.

The district's network was under siege. Students were flooding the network with their cell phones, taking up valuable bandwidth needed for instruction and putting the network, students, and the district at risk. Moreover, passwords to school-owned devices were constantly being compromised, allowing unknown devices onto the network, and the IT department had no way of identifying the devices or their owners. "We had to send teams out to reset passwords—it was unworkable," says Shelley Wilcox, Director of Technology at Abbotsford School District. "We needed a solution that would give us better control of our network—a solution that would tell us who's trying to connect and then could automatically route them to the right network. We also needed to be able to track devices as they moved around the district and locate them if used inappropriately."

FLEXIBLE ACCESS POLICIES, ENFORCED AUTOMATICALLY

The Fortinet network access control (NAC) solution identifies all endpoint devices as they connect to the Abbotsford School District network, performs compliance checks to make sure they have antivirus protection and are not jail broken, and puts them on the appropriate VLAN based on predefined policies for each user group and device type. There's a VLAN for district-owned devices used for learning in the classroom and labs; a BYOD network for teachers, staff, and special-needs students; and a BYOD network for students and guests, which for safety and bandwidth management reasons is routed outside the district to the Provincial Learning Network. "Now you can walk into any facility and NAC will automatically recognize your device and put you on the right network," says Wilcox.

"Using Fortinet's NAC solution, we have much higher security because we know exactly what's on the network, how each device is connected, where it's located, and who is using it. And when people come to any school in our district they know they will get safe, seamless connectivity. NAC enables us to provide better service and increased user satisfaction, and that's huge."

– Shelley Wilcox,
Director of Technology,
Abbotsford School District

Recent initiatives necessitated changes to the BYOD networks. Devices must now be routed through the firewalls to filter websites and content yet remain independent of networked servers and printers. "Thanks to NAC, we can do this easily," Wilcox added.

Wilcox specifically highlights The Fortinet NAC solution's flexible network access and remediation policies if a device is out of compliance. "We now have the ability to specify where, when, and how we want to allow access. As an IT Director, this is one project where we haven't had a lot of resistance."

In addition to controlling access, NAC detects and identifies devices that are already on the network. "We discovered more than 1,000 unregistered, rogue devices which we can now register or block since authentication occurs through active directory," Wilcox says. "Using NAC, we now have much higher security."

REDUCES ADMINISTRATIVE OVERHEAD

NAC also eliminates the need to manage multiple SSIDs at each school, and Wilcox no longer needs to send teams to different schools to reset compromised SSID passwords—something that was very time-consuming for the IT department. "Schools thank us because we're no longer constantly resetting passwords that students had hacked and texted to everyone, and their networks are no longer overwhelmed," Wilcox commented. Her employees are happy too. "Using NAC, it's now easy for us to identify users and manage access to resources using appropriate VLANs. Device registration is handled quickly through online registration or by uploading lists of devices into NAC."

BLOCKS CYBER THREATS AND IDENTIFIES THE PERPETRATOR

NAC is also used to detect and block inappropriate activity on the network as part of Abbotsford's integrated security solution that includes their firewall and filtering software. When the threat detection solution detects a problem, such as the transmission of inappropriate content or a cyber threat, NAC identifies the offending device and user and can block access. Wilcox notes that this visibility and access control are very helpful when investigating an incident. "When you have a powerful tool in the pocket of every kid, you can't see everything all the time," Wilcox observes. "Now, using NAC with our firewall, we can identify the device, where it is, what it's doing, and who is using it. It's a very powerful combination.

"Using Fortinet's NAC solution, we have much higher security because we know exactly what's on the network, how each device is connected, where it's located, and who is using it," said Wilcox. "When people come to any school in our district they know they will get safe, seamless connectivity. NAC enables us to provide better service and increased user satisfaction, and that's huge."

DETAILS

CUSTOMER: Abbotsford School District

INDUSTRY: Education

LOCATION: Abbotsford, British Columbia, Canada

BUSINESS IMPACT

- Automatically provisions network access based on predefined BYOD policies
- Ensures that only authorized users and devices can access the network
- Remediates noncompliant devices
- Integrates with firewalls to help remediate devices on the network if cyber abuse or inappropriate activity is identified
- Tracks all devices across the school district
- Cuts administrative overhead and improves the user experience

SOLUTIONS

- Network Access Control

GLOBAL HEADQUARTERS
Fortinet Inc.
899 Kifer Road
Sunnyvale, CA 94086
United States
