

# INTERNAL SEGMENTATION FIREWALL

Protecting Your Network From The Inside Out

 **52%** of organizations are concerned about security disrupting the internal network

A strong border protects your internal network from external threats.

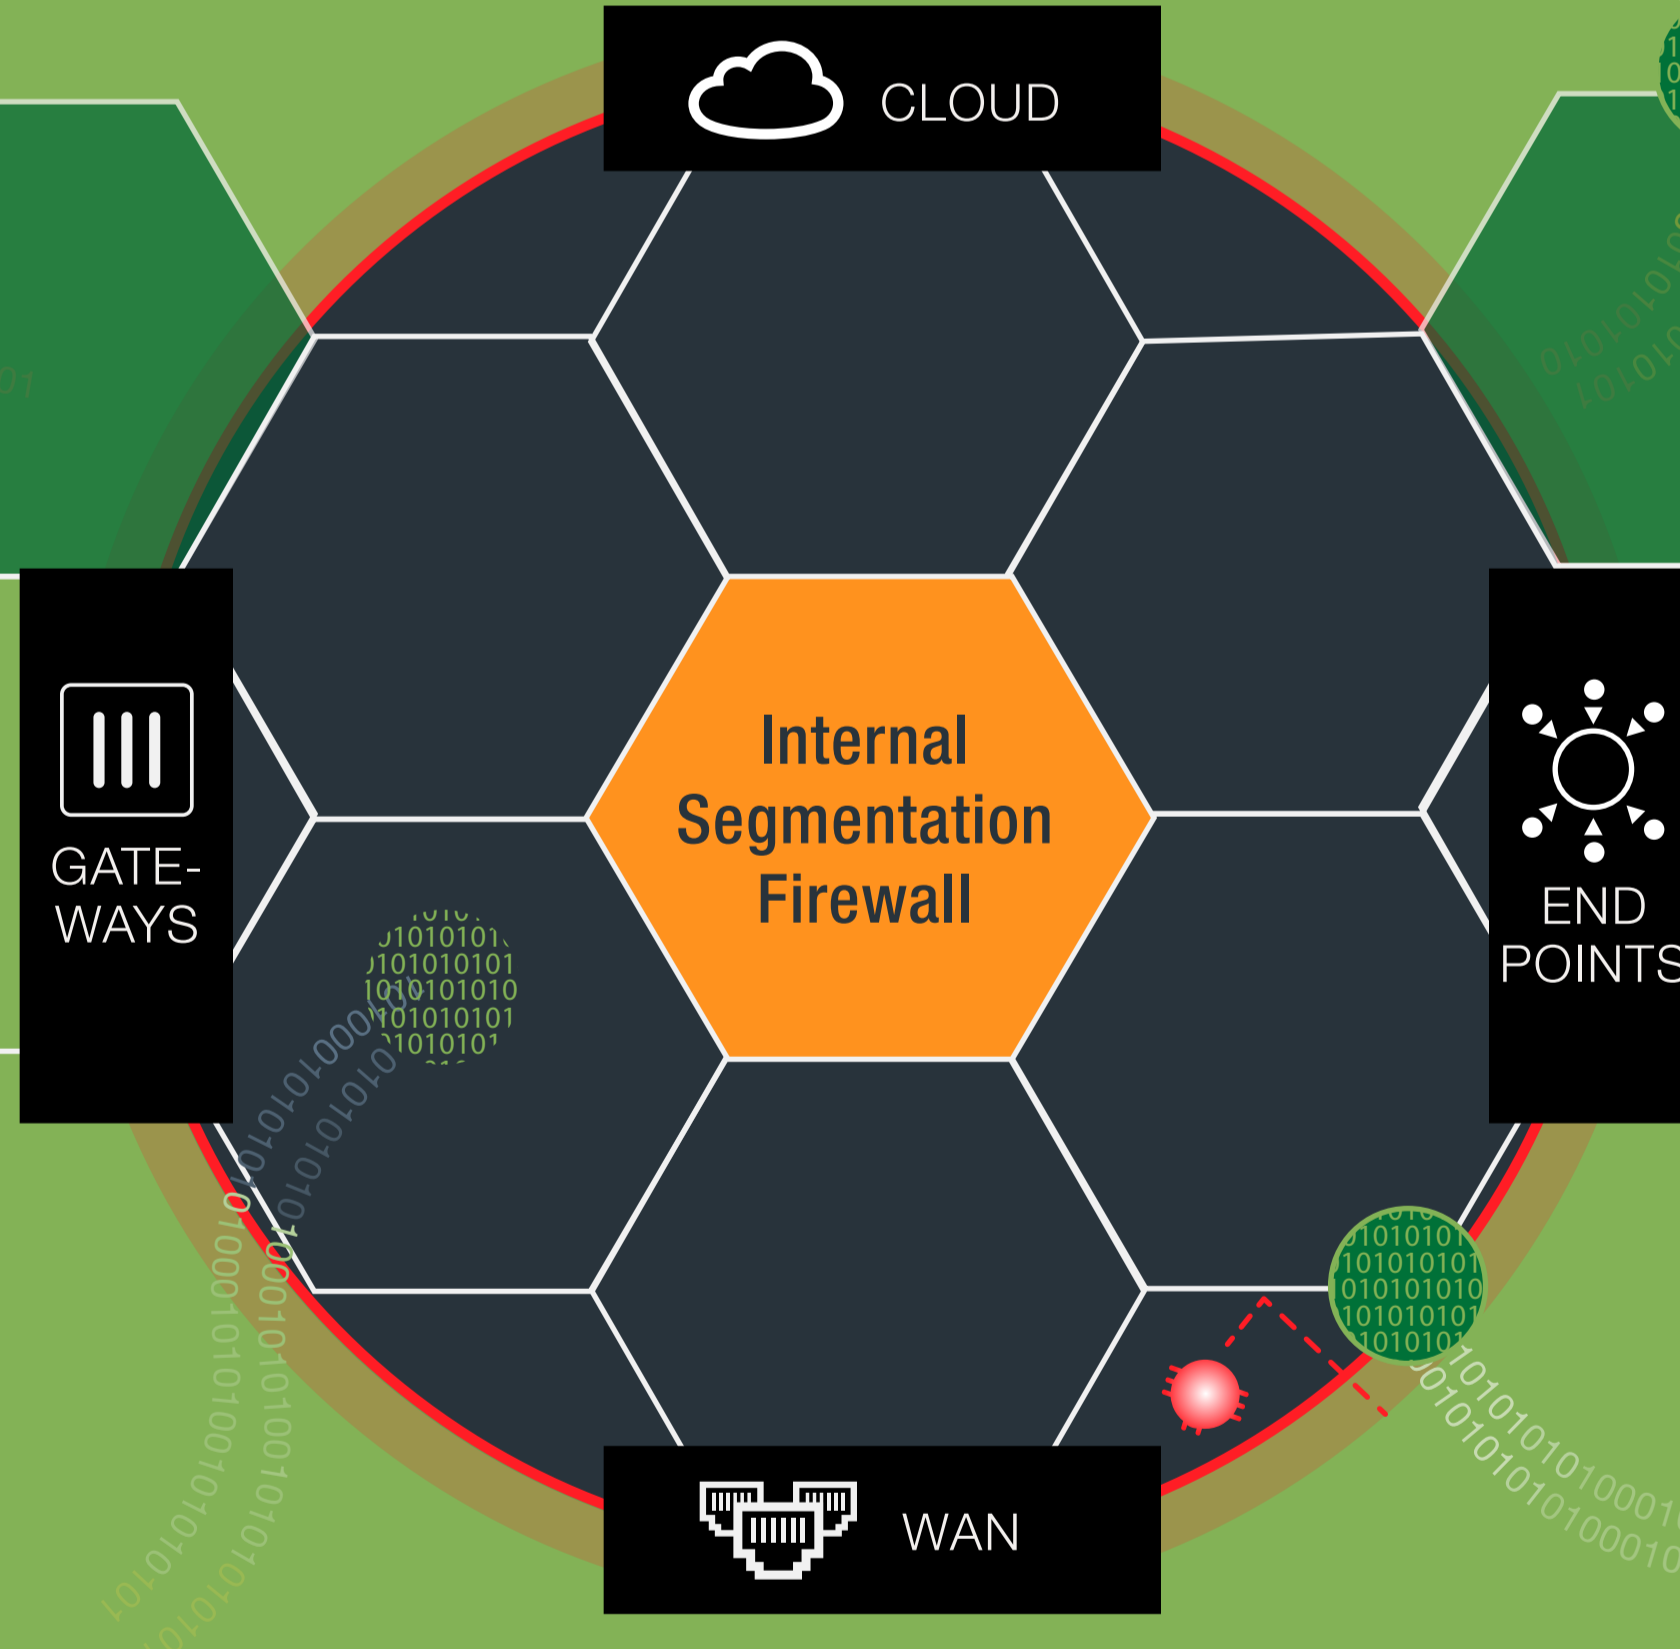

But...

If a threat gets inside the border, it has **access to all your valuable data.**

**You can't just rely on border protection**

A better approach is to segment your internal network by trust zones

Connect the internal trust zone segments with a new class of firewall, the **Internal Segmentation Firewall.**

**Internal Segmentation Firewall**

If a threat penetrates your border, it is unable to **spread within your internal network.**

 **56%** of organizations are evaluating ISFW now or in next 12 months

**FortiGate ISFW** provides segmentation with high performance and threat protection so that your network is protected from the inside out.
