

# Boosting Endpoint Security with Real-time, Automated Incident Response

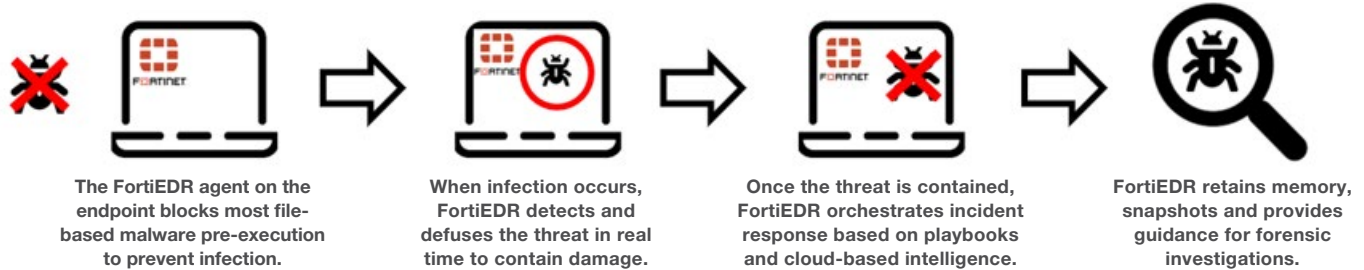

## Executive Summary

Advanced attacks can take just minutes, sometimes even seconds, to compromise endpoints. First-generation endpoint detection and response (EDR) tools simply cannot keep pace. They require manual triage and responses that are not only too slow but also generate many alerts. Such solutions drive up the cost of security operations and slow incident response processes, causing production shutdowns and disrupting system users.

Since January 1, 2016, more than 4,000 ransomware attacks have occurred daily on average.<sup>1</sup>

FortiEDR addresses these deficiencies with advanced, real-time threat protection for endpoints both pre- and post-infection. FortiEDR proactively reduces the attack surface, prevents malware infection, and detects and defuses potential threats in real time. FortiEDR stops breaches and ransomware damage automatically and efficiently, streamlining security operations and keeping users and production equipment online and working.

## How FortiEDR Post-infection Protection Works

## How FortiEDR Bolsters Endpoint Security

FortiEDR is a next-generation endpoint protection solution that packs a broad set of prevention, detection, and response capabilities into a lightweight footprint that is easy to deploy, even on devices with limited system resources. Key capabilities of FortiEDR include discovery and risk mitigation, next-generation antivirus (NGAV), behavior-based detection, real-time blocking, automated incident response, forensic investigation, threat hunting, and virtual patching capabilities (Figure 1). FortiEDR leverages the Fortinet Security Fabric architecture and integrates with Security Fabric components such as FortiGate, FortiNAC, FortiSandbox, and FortiSIEM.

### Proactive Risk Mitigation

FortiEDR continuously scans for unmanaged devices and applications using FortiEDR collectors installed on existing endpoints, providing security teams with full visibility. Analysts can assign communication control policies based on application ratings, vulnerabilities, and real-time threat intelligence. Proactive risk mitigation minimizes the number of unprotected endpoints and reduces the attack surface.

### Real-time Prevention

FortiEDR incorporates a machine learning (ML)-based AV engine to protect against file-based malware. FortiEDR protects endpoints even when they are not connected to the internet. With a small footprint and broad operating system support, FortiEDR can be deployed on devices with limited resources, for example, point-of-sale (POS) terminals running real-time operation systems and process controllers in manufacturing operations.

### Automated Detection and Blocking

FortiEDR uses behavior-based detection to identify and defuse potential threats automatically. This approach is particularly effective against fileless malware, which easily evades traditional AV defenses by hiding in memory and never touching the disk. Fileless threats make use of legitimate system resources (also called living off the land) and execute attacks entirely in memory or deliver other attack vectors such as ransomware to accomplish their malicious goals.

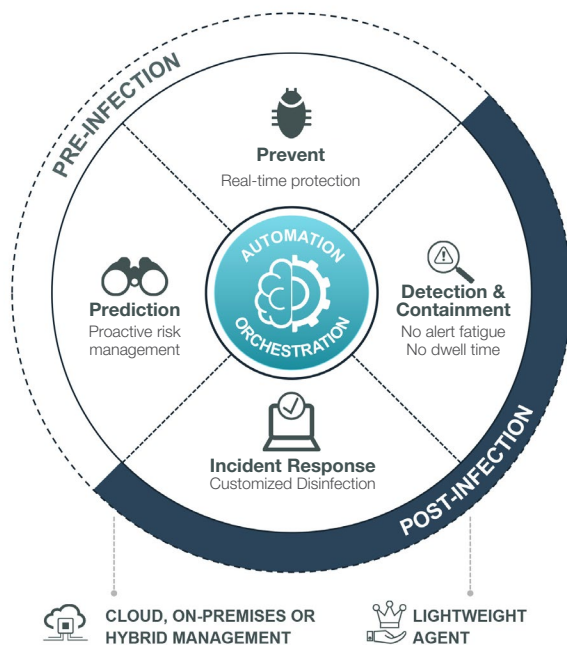

Figure 1: FortiEDR offers pre- and post-infection features to improve endpoint detection and response.

When suspicious behavior occurs, FortiEDR immediately thwarts the attacks by blocking all requested outbound communications and blocking access to the file system. At the same time, the FortiEDR cloud-based back end continuously classifies the threats for appropriate response actions and eliminates noise to streamline security analysis and operations.

### Orchestrated Incident Response

FortiEDR comes with customizable playbooks that enable orchestrated and automated incident response and remediation. Typical automated activities invoked by playbooks include terminating malicious processes, removing files, cleaning up persistency, rolling back malicious changes, notifying users, isolating applications and devices, and opening tickets.

Not all endpoints have the same risk tolerance. For example, the controller system on the manufacturing floor requires high availability and therefore has a lower risk tolerance than an employee's laptop. With playbooks, security teams can design a context-based incident response that initiates the appropriate actions based on threat classification and the endpoint group. This approach ensures a consistent incident response, reduces the time security teams spend on routine tasks, and helps organizations align their endpoint security policies with risk tolerance.

### Forensic Investigation

FortiEDR features a unique guided interface that offers clear explanation for alerts and suggests logical next steps for the forensic investigation. FortiEDR automatically enriches data with detailed information on attack techniques from trusted sources such as the ATT&CK database. Patented code-tracing technology gives security teams full visibility across the cyberattack chain. FortiEDR also reserves memory snapshots of attacks to aid investigation.

### Business Benefits

FortiEDR delivers significant business value in the areas of endpoint protection, incident response, security operations, and business continuity.

#### Improve Security with Real-time Protection

Working in real time and leveraging ML, FortiEDR stops breaches and prevents data loss and ransomware damage in real time, eliminating the time gap between detection and response. FortiEDR not only improves the organization's endpoint protection but also minimizes the impact of threats that manage to bypass the prevention stack.

#### Optimize Security Operations

FortiEDR optimizes security workflows with customizable, standardized incident response processes. FortiEDR frees staff time and reduces alert fatigue by automating repetitive tasks and minimizing false positives. By automatically combining alerts, linking events, and presenting a coherent attack graph, FortiEDR streamlines incident response and forensic investigations.

## Ensure Business Continuity

FortiEDR enables response and remediation on running systems, which prevents production disruptions and maintains user productivity. FortiEDR supports legacy equipment with limited system resources, extending their useful life. Security teams can use FortiEDR to roll back malicious damage and avoid costly system reimaging.

## FortiEDR Feature Summary

Pre-infection		Post-infection			
					
<b>Discover &amp; Predict</b>	<b>Prevent</b>	<b>Detect</b>	<b>Defuse</b>	<b>Respond &amp; Investigate</b>	<b>Remediate &amp; Roll Back</b>
<b>Proactive risk mitigation</b>	<b>Pre-execution protection</b>	<b>Detect threats in real time</b>	<b>Stop breach and data loss</b>	<b>Full attack visibility</b>	<b>Disinfection</b>
<ul style="list-style-type: none"> <li>Discover rogue devices &amp; IoT</li> <li>Application &amp; reputation</li> <li>Vulnerabilities</li> <li>Risk-based policies reduce attack surface</li> <li>Virtual patching</li> </ul>	<ul style="list-style-type: none"> <li>Kernel-level</li> <li>Machine learning &amp; signature-less</li> <li>Application</li> </ul>	<ul style="list-style-type: none"> <li>No alert fatigue</li> <li>Provide malware classification</li> <li>Display IOCs</li> <li>Deliver full attack chain</li> </ul>	<ul style="list-style-type: none"> <li>First &amp; only real-time post-infection blocking</li> <li>Block outbound communication</li> <li>Prevent data exfiltration</li> <li>Prevent data tempering &amp; ransomware encryption</li> </ul>	<ul style="list-style-type: none"> <li>Customizable incident response playbooks</li> <li>Eliminate dwell time</li> <li>Capturing forensic data</li> <li>Memory snapshot for fileless attack</li> <li>Conduct threat hunting in your time</li> </ul>	<ul style="list-style-type: none"> <li>Roll back malicious changes</li> <li>Remove bad files</li> <li>Clean up persistency</li> <li>Eliminate re-image/rebuild</li> <li>Ensure business continuity</li> <li>REST API output for external remediation tools</li> </ul>

## Fortinet Deployment and MDR Services

- Fortinet Professional Services provides expert assistance for architecture planning, configuration, playbook setup and customization, and training.
- FortiResponder, Fortinet's MDR service, offers 24x7 threat monitoring, alert triage, and remote remediation services. providing users with peace of mind.
- Certified Fortinet MSSP partners deliver MDR services including fully managed SOCs.

## Conclusion

With the steady increase in the number and sophistication of advanced threats and ransomware, organizations must increase their security measures across the board, including their endpoints. FortiEDR offers next-generation endpoint protection, detection, and response that is lightweight and easy to deploy. With FortiEDR, security teams can boost endpoint security, thereby speeding up incident response, streamlining security operations, and avoiding costly disruptions to production lines and knowledge workers.

## Typical Use Cases for FortiEDR

### Operational Technology Security

FortiEDR prevents, detects, and defuses threats in operational technology (OT) environments while keeping machines online to avoid production shutdowns. FortiEDR discovers vulnerabilities and delivers mitigation controls such as virtual patching to protect systems from exploits until the next available maintenance window. FortiEDR features a small footprint that supports legacy equipment and air-gapped systems without affecting device performance.

### Point-of-Sale Security

FortiEDR protects credit-card information at point of sale (POS), stopping attacks at the source. Payment Card Industry Data Security Standard (PCI DSS) certified, FortiEDR prevents data exfiltration in the event of system compromise. FortiEDR delivers virtual patching to shield POS systems from vulnerabilities. FortiEDR offers embedded OS support with a small footprint suitable for legacy POS equipment.
